REASONS FOR ALLOWANCE

1. The following is an examiner's statement of reasons for allowance:

The prior art of record does not teach or suggest individually or in combination a local host having a communication processing device (CPD) to take over TCP/IP protocol processing after a TCP connection is established between the local host and a remote host. The CPD has special hardware configured to analyze IP and TCP headers of communication network packets and obtain a MAC (media-access control) address, an IP address, and a TCP port from the CPU of the local host and off-load the subsequent processing of message packets in the CPD, wherein when the CPD controls the TCP connection, the CPU no longer engages in the TCP/IP protocol processing.

Among the closest prior art, Bennett teaches dedicating a network interface card (NIC) to off-load a portion of the TCP protocol processing by preparing the TCP ACK (acknowledgement) packets for the CPU of the host. Because of the fact that only ACK packets are prepared at the NIC, Bennett does not specifically providing a MAC address, IP address, and TCP port (from the host's CPU) to the NIC. Further, Bennett is silent about whether or how the NIC may take control of the connection once the TCP connection is established.

Another close prior art, Petty, which surfaced in a recent search, teaches a special hardware serving as a TCP processing accelerator to a plurality of servers that are linked to the accelerator via local fabric (switches). The accelerator is not part of the servers; it is an intermediary instead. Communication packets are passed through the intermediate entity with

TCP packet embedded in a packet prepared for communicating through the fabric. Thus even though the accelerator functions similar to the CPD, the control mechanism appears to be different. That is, the accelerator intercepts commands that are delivered to the server's protocol stacks and implement the protocol processing in special hardware, rather than carrying out in the stacks.
